TECH TIPS FOR USING YOUR REFERENCE MATERIALS

To help our customers we've captured some key questions asked about our reference materials and getting the most from your products:

1

What is the difference between ISO Guide 34 and ISO 17034 produced reference materials?

ISO 17034:2016 specifies general requirements for the competence and consistent operation of reference material producers. It also sets out the requirements in accordance with which reference materials are produced. It is intended to be used as part of the general quality assurance procedures of the reference material producer.

According to International Organization for Standardization, ISO 17034 replaces the ISO Guide 34 and in doing so, changes all recommendations of the Guide into requirements. Thus, there is no difference between how a product is indicated to be produced under ISO Guide 34 and ISO 17034. More relevant changes include inclusion of more detail on the required documentation in accordance with ISO Guides 31. All Dr. Ehrenstorfer products produced under ISO 17034 and their Certificates of Analysis comply completely to the requirements of the accreditation.

2

How do I tell which products were produced under ISO 17034?

As leaders in quality not only are our Dr. Ehrenstorfer production facilities accredited to ISO 17034, we actively produce the majority of our portfolio is under our ISO 17034 scope of accreditation. These materials are clearly identified in the certificate of analysis and in this catalogue by the symbol †. This range is constantly increasing, therefore if you are unable to find the product that you require, please contact your local sales office or email us at dr.ehrenstorfer@lgcgroup.com.

3

Can I still use products that are not produced under ISO 17034 for my analysis?

The appropriate reference materials for your analysis are determined by the specific method you are following. All Dr. Ehrenstorfer reference materials are designed, produced and verified in accordance with a registered quality management system ISO 9001 and all analytical measurements were performed under our ISO/IEC 17025 scope of accreditation - ensuring traceability. Our certificates of analyses are designed in accordance with ISO Guide 31, whether or not they were produced under our ISO 17034 scope of accreditation, providing the highest standard at all quality levels.

4

How much material is in the bottle/ampoule?

Dr. Ehrenstorfer reference materials are supplied with a nominal weight or volume and are typically overfilled with up to 10% more of the product than stated. In order to use the material for your analysis, it is usually practical to prepare a solution. The solution preparation procedure described below can be used to calculate the exact amount of material present.

5

The container looks empty – is there anything inside?

Don't worry - Yes, there is! Where small quantities of solid material are supplied, this can be dispersed over the inside surface of the container. Liquid may also coat the inner surface of the container which may not be visible. To best extract all material from container, it is best to transfer the contents with appropriate solvent and dry according to procedure below to calculate the exact amount of material present.

6

How can I extract all material from the bottle/ampoule and prepare a solution from a neat Dr. Ehrenstorfer product?

In order to recover all the material from the container the following procedure can be used. We recommend storing the vial / bottle in an upright position for at least 24 hours prior to handling.

- 1 Ensure the container is clean and dry. Using an analytical balance, weigh the container (including the lid for bottles) and record the weight.
- 2 Using a suitable solvent, carefully transfer the contents to a volumetric flask. Rinse the container (including the lid) at least three times and combine all rinses to ensure a complete transfer of material.
- 3 Dry the empty container completely, then using an analytical balance, weigh the dry, empty container and lid and record the weight.
- 4 Calculate the difference in weight between the first and second weighing. The difference in weight is the amount of material that has been transferred.
- 5 Make the solution up to volume in the volumetric flask. The concentration of the solution can then be determined. Where larger quantities of material are supplied, you may wish to only transfer an aliquot of the material. In these cases, you may need to use a weighing boat and a spatula to weigh the material before transferring it into the volumetric flask.

7

My Dr. Ehrenstorfer reference material was not shipped under the storage conditions found on the certificate of analysis. Is the product still ok to use?

The storage conditions on the certificate are for the long-term storage of the material. Normally products are not shipped under controlled conditions as shipping times are generally <72 hours and therefore short-term. One sample of each lot is kept aside to enable checks on the specific lot to be undertaken if required.

WHAT OUR CERTIFICATE OF ANALYSIS TELLS YOU

Every product you receive comes with a Dr. Ehrenstorfer Certificate of Analysis, which provides a full description of the material to which it relates, as well as a summary of the analyses undertaken during the characterisation process.

The following examples show Dr. Ehrenstorfer Reference Material Certificates of Analysis for neat products.

ISO Guide 34 Reference Material

1 Article Code: DRE-C1609000
2 Article Name: Phosgene sulfonide
3 Formula: C7H13O3S3
Mol. Weight: 276.36
CAS No.: 2588-03-6

4 Lot Number: G142127
5 Expiry Date: 05.06.2020
6 Storage Temperature: 4°C ± 4°C

7 Storage and handling: The RM should be stored in the original sealed bottle at the temperature given above. After use the bottle should be tightly closed and protected from moisture and light. The purity data is valid for original sealed bottles under recommended storage conditions only.

8 Purity:	99.02% (g/g)
Expanded Uncertainty (±):	± 0.88% (g/g)

9 The uncertainty of this standard is calculated in accordance with ISO Guide 34 and ISO 9000:2015. Quantifying Uncertainty in Analytical Measurement, Second Edition. The expanded uncertainty is $U_{95\%}(k=2)$, where k is the coverage factor at the 95% confidence level ($k=2$). Uncertainty $u_{95\%}(k=2)$ is based on the combination of the uncertainties associated with each individual parameter involved in the analysis of the product: $u_{95\%}(k=2) = \sqrt{u_{95\%}^2 + u_{95\%}^2 + u_{95\%}^2}$. $u_{95\%}(k=2)$ is the uncertainty of purity determination; $u_{95\%}(k=2)$ uncertainty of homogeneity; $u_{95\%}(k=2)$ uncertainty of stability (see long-term, $u_{95\%}(k=2)$ and short-term, $u_{95\%}(k=2)$ and $u_{95\%}(k=2)$ are not included in the calculation as the stability statement is based on real evidence opposed to simulation. Minimum sample: 1 mg is recommended as the minimal sample amount. If less material is used, it is recommended to increase the certified uncertainty by a factor of two for half sample and a factor of four for quarter of sample. Intended use: Use this RM as calibrant for chromatography or any other analytical technique.
